kompiert So I've been playing around with trying to run an nvidia gtx 980 in a vm through wine. I've followed this guide, which is a noobish guide. I'm able to get my machine to boot into the live ubuntu 14.04 (that's on the nvidia download link) but I can't seem to get my machine to boot into ubuntu 16.04. I'm getting the following error in the terminal:

```
err:file_open_path:ERROR_IO_FILE ERROR Opening registry hive (see system) Failed to open file C:/Progra~1/NVIDIA Corporation/304.109/en-us/nvidia-cg-toolkit.reg:Error loading module "" at 0x011720FD: 0x8024000b This is the output from
```

the command winecfg I can't seem to find out what else to do because I've tried following different guides but none of them have worked for me. A: I think the error you get is because your program, instead of creating the registry files, tries to open them, and Wine fails. In my experience the easiest way to use a Windows program with Wine is to first run the Windows program as a Wine virtual application on your computer, and then open the program from the virtual application's menu. If you do that, you should be able to see a Wine GUI application launcher, click it, and click on your program (like an exe file), which should create the registry files needed. How To Get Ultra Fast Twitch Traffic With Twitch SEO Twitch SEO is designed to be an easy to use and straightforward platform that allows you to instantly publish links to your videos on the best sites in the world.
